MODULE 10 · CHECKLIST

PR review checklist for designers

What to look for in a pull request when you're the design eye in the room.

Before you read the diff

- [ ] **Description explains what and why**
  Links the Figma frame and the spec; says what changed and why.
- [ ] **Screenshots or a Storybook link**
  Every variant and state, before / after. No visuals, no review.
- [ ] **CI is green**
  Lint, type-check, build, and tests pass before you spend time on it.

In the code — the 5 red flags

- [ ] **No hardcoded values**
  No hex colors, Tailwind color classes, or arbitrary pixel values — tokens only.
- [ ] **Right element**
  <button> for actions, <a> for navigation, real headings and landmarks — not s.
- [ ] **Accessibility attributes present**
  Labels, aria-* where needed, visible focus ring, keyboard operable.
- [ ] **Reuses existing components**
  Imports the library component instead of recreating a lookalike.
- [ ] **No fixed heights on text**
  Padding drives size so content, locale and text scaling can grow.

In the preview

- [ ] **Matches the spec and Figma**
  Spacing, type, color, radius — checked against computed values, not by eye.
- [ ] **All states work**
  Hover, focus, active, disabled, loading, error.

- [ ] **Breakpoints hold**

  375px, 768px, 1440px with no overflow or clipping.

- [ ] **Storybook a11y addon is clean**

  Zero Critical / Serious violations.

Leaving feedback

- [ ] **Comments are precise and kind**

  State what's wrong, what the spec says, and the expected value. Attach a screenshot.

- [ ] **Spec vs. code disagreement is resolved**

  Decide which is right, then update the spec or the code — never leave them out of sync.
