MODULE 00 · CHECKLIST

Prompt precision checklist

Ten questions to run before you hit enter. If AI has to guess, the prompt isn't done.

- [ ] **1. Did I name the exact thing to build?**
  Component, page, or fix — one target per prompt, not "make it nice".
- [ ] **2. Did I give real measurements?**
  Padding, font size, weight, radius, opacity — numbers, not adjectives.
- [ ] **3. Did I reference tokens, not raw values?**
  Colors, spacing and radii come from design.md / CSS custom properties, never hex.
- [ ] **4. Did I list every variant?**
  Filled, outlined, ghost … and what each one signals.
- [ ] **5. Did I list every state?**
  Default, hover, focus, active, disabled, loading, error — and what changes in each.
- [ ] **6. Did I specify sizes and responsive behaviour?**
  sm / md / lg, and what happens at 375, 768 and 1440px.
- [ ] **7. Did I state the accessibility requirements?**
  Semantic element, keyboard behaviour, visible focus ring, contrast (WCAG 2.2 AA).
- [ ] **8. Did I say what NOT to do — and why?**
  Constraints with intent: "no fixed height — it must grow with content".
- [ ] **9. Did I point at the source of truth?**
  Attach or name the spec, design.md, CLAUDE.md, or the Figma frame so AI reads instead of invents.
- [ ] **10. Can I tell pass from fail?**
  Write the acceptance criteria. If I can't verify the output, I can't review it.
